Chapter 5

Working with GenICam GenTL Devices

5.1 GenTL Overview

FLIR GenTL Producer is a software driver that implements the GenICam™ GenTL 1.5 standard (<https://www.emva.org/>). It allows users to enumerate, communicate and stream from FLIR GigE Vision and USB3 Vision devices in a generic way independent from the underlying transport technology. This allows third-party software such as MATLAB (<https://www.mathworks.com>) and other software libraries to work with FLIR devices in a transport layer agnostic way. These applications are referred to as "GenTL Consumers," which directly use one or more GenTL Producers.

NOTE: Consumer applications must be aware of differences in device capabilities and be prepared to handle specific device models differently.

5.2 Installation

In order to use a FLIR GenTL producer, it needs to be properly registered and installed on the system. **The FLIR Producer comes packaged with the full Spinnaker SDK installer as of 2.x or newer.**

The GenTL Producer is provided as a platform dependent, dynamic loadable library file with the `.cti` ("Common Transport Interface") extension.

The Spinnaker SDK installer stores the folder paths for 32-bit and 64-bit GenTL Producers (`.cti` files) in environment variables named `GENICAM_GENTL32_PATH` and `GENICAM_GENTL64_PATH`, respectively. If there are multiple GenTL Producers installed on the system, path entries must be separated by `;` on Windows and `:` on UNIX-like systems.

NOTE: A 32bit GenTL consumer application will require a 32-bit GenTL producer and a 64-bit application will require a 64-bit producer library.

5.3 Troubleshooting

5.3.1 Enable FLIR GenTL Logging

FLIR GenTL Logging can be enabled if a configuration file with the name "log4cpp.gentl.property" resides in the path of where the consumer application executes from. For MATLAB, this is where the working directory is set and may default to the "Downloads" folder on Windows.

Sample log4cpp.gentl.property configuration file:

```
# FLIR GenTL Property Configuration file
log4cpp.rootCategory=ERROR, rootAppender
log4cpp.category.GenTLCategory=ERROR, GenTLCategory

log4cpp.appender.rootAppender=ConsoleAppender
log4cpp.appender.rootAppender.layout=PatternLayout
log4cpp.appender.rootAppender.layout.ConversionPattern=[%p] %d [%t] %m%n

log4cpp.appender.GenTLCategory=RollingFileAppender
log4cpp.appender.GenTLCategory.fileName=$(ALLUSERSPROFILE)\Spinnaker\Logs\GenTL.log
log4cpp.appender.GenTLCategory.append=true
log4cpp.appender.GenTLCategory.maxFileSize=1000000
log4cpp.appender.GenTLCategory.maxBackupIndex=5
log4cpp.appender.GenTLCategory.layout=PatternLayout
log4cpp.appender.GenTLCategory.layout.ConversionPattern=[%p] %d [%t] %m%n
```

5.3.2 USB3 Device Image Tearing

Image tearing could occur with certain USB3 host controllers when streaming with a GenTL producer. To work around the issue, make sure the size of each buffer announced to the FLIR GenTL producer is 1024 bytes aligned. The size of each buffer should be $(\text{bufferSize} + 1024 - 1) / 1024 * 1024$ where 1024 is the USB3 packet transfer size.

For more information about image tearing causes and solutions, please refer to: <https://www.flir.com/support-center/iis/machine-vision/application-note/image-tearing-causes-and-solutions/>

Software Maintenance Policy

7.1 GenTL Overview

This document outlines the FLIR maintenance policy for Spinnaker Software Development Kit (SDK). FLIR regularly provides SDK updates that may contain support for new or updated features, enhancements, updated drivers, updated examples, bug fixes or documentation updates. Updates may also address changes with introducing and/or deprecating language runtimes, operating systems and dependencies.

We recommend users to stay up-to-date with SDK releases to keep up with the latest features, bug fixes and performance improvements. Continued use of an unsupported SDK version is not recommended and is done at the user's discretion.

Spinnaker SDK releases are published through our website and can be found here: <https://www.flir.ca/products/spinnaker-sdk/>

7.2 Platform Support Policy

7.2.1 Windows Support

FLIR will continue to maintain, fix and build the last two major versions of Spinnaker SDK against the latest available version of Windows x86/x64. The latest three versions of Visual Studio compiler toolchain are supported on Windows. Only the latest compiler toolchain on the latest available version of Windows are being actively tested.

7.2.2 Linux Desktop Support

FLIR will continue to maintain, fix and build the last two major versions of Spinnaker SDK against the latest two LTS versions of Ubuntu x86/x64. Only the latest x64 LTS version of Ubuntu is being actively tested.

7.2.3 Linux Embedded Support

FLIR will continue to maintain, fix and build the last two major versions of Spinnaker SDK against the latest supported LTS version of Ubuntu ARMHF/ARM64 for a specific board. Only the latest LTS Ubuntu version on an ARM64 board is being actively tested. Contact sales if you need support for a specific embedded board.

7.2.4 MacOS Support

FLIR will continue to maintain, fix and build the last two major versions of Spinnaker SDK against MacOS Mojave (10.14). Contact sales if you need newer MacOS support.

7.3 Versioning Policy

Spinnaker SDK releases use a modified semantic versioning scheme and is indicated by four sets of numbers separated by periods:

MAJOR.MINOR.0.PATCH

- MAJOR: Version change that can include incompatible API changes
- MINOR: Version change that adds functionality in a backwards-compatible manner
- PATCH: Version change with backwards-compatible fixes

11.2.2.6 spinAutoExposureControlPriorityEnums

```
enum spinAutoExposureControlPriorityEnums
```

< Selects whether to adjust gain or exposure first. When gain priority is selected, the camera fixes the gain to 0 dB, and the exposure is adjusted according to the target grey level. If the maximum exposure is reached before the target grey level is hit, the gain starts to change to meet the target. This mode is used to have the minimum noise. When exposure priority is selected, the camera sets the exposure to a small value (default is 5 ms). The gain is adjusted according to the target grey level. If maximum gain is reached before the target grey level is hit, the exposure starts to change to meet the target. This mode is used to capture fast motion.

ChunkScan3dOutputMode_RectifiedC	Rectified 2.5D Depth map. The distance data has been rectified to a uniform sampling pattern in the X and Y direction. The data is a 2.5D range map only. If a complete 3D point cloud is rectified but transmitted as explicit coordinates it should be transmitted as one of the "CalibratedABC" formats.
ChunkScan3dOutputMode_RectifiedC_Linescan	Rectified 2.5D Depth map with varying B sampling. The data is sent as rectified 1D profiles using Coord3D_C pixels. The B (Y) axis comes from the encoder chunk value.
ChunkScan3dOutputMode_DisparityC	Disparity 2.5D Depth map. The distance is inversely proportional to the pixel (disparity) value.
ChunkScan3dOutputMode_DisparityC_Linescan	Disparity 2.5D Depth map with varying B sampling. The distance is inversely proportional to the pixel (disparity) value. The B (Y) axis comes from the encoder chunk value.

```
enum spinTLStreamBufferHandlingModeEnums
```

< Available buffer handling modes of this data stream:

Enumerator

StreamBufferHandlingMode_OldestFirst	The application always gets the buffer from the head of the output buffer queue (thus, the oldest available one). If the output buffer queue is empty, the application waits for a newly acquired buffer until the timeout expires.
StreamBufferHandlingMode_OldestFirstOverwrite	The application always gets the buffer from the head of the output buffer queue (thus, the oldest available one). If the output buffer queue is empty, the application waits for a newly acquired buffer until the timeout expires. If a new buffer arrives it will overwrite the existing buffer from the head of the queue (behaves like a circular buffer).
Generated by Doxygen	

Enumerator

StreamBufferHandlingMode_NewestOnly	The application always gets the latest completed buffer (the newest one). If the Output Buffer Queue is empty, the application waits for a newly acquired buffer until the timeout expires. This buffer handling mode is typically used in a live display GUI where it is important that there is no lag between camera and display.
StreamBufferHandlingMode_NewestFirst	The application always gets the buffer from the tail of the output buffer queue (thus, the newest available one). If the output buffer queue is empty, the application waits for a newly acquired buffer until the timeout expires.
